BONE TISSUE SURFACE TREATMENT

The JDIcon Plus dental implants are available in two versions:

1. Fully treated with SLA surface treatment
2. With 1.5 mm anodized implant collar and the body surface treated with SLA

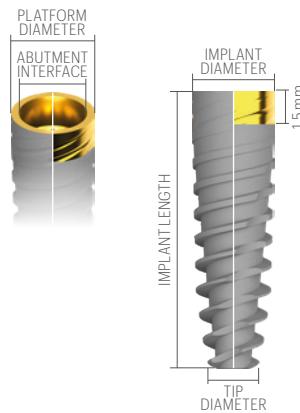

The S.L.A. surface is obtained through the procedure of sandblasting with large grit and acid-etching (SLA) which guarantees an optimal microtopography of the implant surface that improves the osteointegration.

Note: The picture above is generated by a Scanning electron microscope (SEM) and shows the roughness values, expressed as Ra, of the two surfaces of the implant treated with S.L.A. and Anodization.
